Aluminum coupling forks

for delta handling

we're on it.

Aluminum coupling forks

for delta handling

Your **benefits** at a glance:

- the increased stiffness of the handling reduces vibration in the handling and machine, which has a particularly positive effect at high speeds
- more precise article infeed
- improvement of register accuracy

- by switching from carbon coupling forks to aluminum coupling forks the stiffness of the arms significantly increases
 - this results in considerably less vibration during acceleration and deceleration of handling, especially at high cycle rates
- a conversion is particularly recommended when worn bearings are planned to be exchanged

Characteristics

- mechanical conversion
- no change to the base frame
- we recommend the retrofitting by one of our qualified service technicians
