N-circulations

we're on it.

N-circulations

Your **benefits** at a glance:

- extra effort for re-imprinting is deleted
- complete drying even with very high paint application (e. g. thick film printing)
- high register accuracy

- with aid of the function N-circulations, an article can go through the printing process several times
- an article is not removed from the machine after the first process cycle, but remains for a freely selectable but limited number of further cycles in the machine
- the function thus allows a gradual very thick layer of paint without re-imprinting
- due to the remaining part of the article in its recording, the registration accuracy is much more precise than when re-imprinting
- the article does not need to be entered again
- due to the layered color application and the possibility for interim drying, a complete color drying in the thick layer decoration can be guaranteed

Characteristics

- software expansion (HMI and machine software)
